

● PROJECT OVERVIEW

Polymarket Viewer

A fast, zero-dependency web app for browsing live prediction markets

Data via Polymarket Gamma API · Vanilla HTML / CSS / JS

Why this exists

- Polymarket hosts thousands of live prediction markets, but scanning them quickly is hard.
- Traders want a clean, at-a-glance view of what's hot right now — volume, odds, and deadlines.
- Goal: a lightweight viewer that loads instantly and needs no account, no build, no backend.

WHAT IT DOES

Key Features

Live market grid

Pulls the top active markets and renders them as responsive cards.

Search

Instant client-side filtering of markets by question text.

Sorting

Order by 24h volume, liquidity, newest, or soonest to close.

Outcome pricing

Shows each outcome with cents-on-the-dollar odds, color-coded Yes/No.

Refresh

One click re-fetches the latest data from the Gamma API.

Light & dark

Adapts automatically to the viewer's system color scheme.

Data Flow

Tech Stack

MARKUP	<code>index.html</code>	Semantic HTML with a <code><template></code> for cards
STYLING	<code>styles.css</code>	CSS custom properties, grid layout, auto light/dark
LOGIC	<code>app.js</code>	~165 lines of dependency-free vanilla JavaScript
DATA	<code>Gamma API</code>	Polymarket's public REST endpoint for markets
HOSTING	<code>Cloudflare Pages</code>	Static deploy — no build step, no server

Why so simple?

- Zero dependencies — the entire app is three static files served as-is.
- No framework means no build pipeline, tiny payload, and instant cold loads.
- All filtering and sorting happen client-side for snappy, network-free interaction.
- Theme follows the OS via prefers-color-scheme — no toggle to maintain.

What's next

- Pagination / infinite scroll beyond the first 60 markets.
- Category and tag filters (politics, crypto, sports).
- Sparkline price history on each card.
- Favourites saved to local storage.
- Auto-refresh on an interval with a live indicator.

Thanks for watching
